

Concentrations (ng/mL) of [pyrethroid pesticide](#) metabolites in urine samples collected from 101 firefighters in 2010 - 2011 for the [Firefighter Occupational Exposures \(FOX\) Project](#)

Pyrethroid Pesticide Metabolite ^a	Geometric Mean (95% Confidence Interval)	Selected Percentiles				Detection Frequency	Limit of Detection (LOD)
		25 th	50 th	75 th	95 th		
3-PBA	0.54 (0.43 – 0.67)	0.28	0.51	0.99	3.7	98.0%	0.050
4F-3-PBA	*	<LOD	<LOD	<LOD	0.060	10.9%	0.050

a. See page two for [explanation of terms](#).

* Geometric mean was not calculated because the chemical was found in less than 65% of the study group.

Abbreviations, full chemical names, Chemical Abstracts Service Registry Numbers (CASRN), and parent [pyrethroid pesticide\(s\)](#) for analytes measured

Abbreviation	Full Name of Analytes	CASRN ^a	Parent Pyrethroid Pesticide(s)
3-PBA	3-Phenoxybenzoic acid	3739-38-6	Cyhalothrin, cypermethrin, deltamethrin, fenpropathrin, permethrin, and/or tralomethrin
4F-3-PBA	4-Fluoro-3-phenoxy-benzoic acid	77279-89-1	Cyfluthrin

a. See page two for [explanation of CASRN](#).

Explanation of Terms

ng/mL	Nanograms of the chemical per milliliter of urine.
Metabolite	Metabolites are formed when chemicals, such as environmental contaminants or drugs, are broken down or changed through natural processes in the body. Metabolites are measured in biomonitoring studies as indicators of exposure to certain chemicals.
Geometric mean	The geometric mean is an estimated middle value of a set of numbers. This is different than the average, also called the "arithmetic mean." A geometric mean is sometimes calculated when the set of numbers contains some extreme values. For example, the geometric mean of the set of numbers "1, 2, 2, 3, 4, 5, 5, 6, 10, 100" is calculated by <i>multiplying</i> all ten numbers together and then <i>raising the product to the 1/10th power</i> , giving 4.8. To compare, the arithmetic mean is calculated by <i>adding</i> all ten numbers and <i>dividing by 10</i> , giving 14.
95% confidence interval	A <i>sample</i> is a subset of a larger <i>population</i> . A confidence interval for a statistical measure is a range of values estimated from <i>sample</i> data. This interval is likely to include the true value of the statistical measure, such as a geometric mean, for the larger <i>population</i> . A 95% confidence interval for a statistical measure implies that we are 95% confident that the range includes the true <i>population</i> value for this measure.
Percentiles	Percentiles are best explained by an example: if the 75 th percentile is 1.5 µg/L, this means that 75% of participants had levels less than or equal to 1.5 µg/L.
Detection frequency (percent detected)	The percentage of study participants with a measurable level of a chemical in their blood or urine.
Limit of detection (LOD)	The LOD is the lowest level of a chemical that the laboratory can measure in blood or urine.
Below the limit of detection (<LOD)	Below the LOD means that the laboratory could not detect the chemical. This may have been because the chemical was not present at all or because it was present at such a low level that the laboratory could not measure it.
CASRN - Chemical Abstracts Service Registry Number	The CASRN is a unique identification number assigned to individual chemicals by the Chemical Abstracts Service division of the American Chemical Society.
